

Inside the World of Cryptographic Algorithm Validation Testing

Sharon Keller

CAVP Program Manager

NIST

ICMC, May 2016

CAVP

Mission

- To provide federal agencies—in the United States and Canada—with assurance that a cryptographic algorithm has been implemented according to the specifications in the applicable standard.

CAVVP

History

- Established in 2003 by NIST and the Communications Security Establishment (CSE) of Canada as a separate program from the CMVP.
- Cryptographic algorithm validations are a prerequisite to cryptographic module validations.

CAVVP

Algorithm Validation Testing

Determining Algorithms to be validated

- **NIST's Cryptographic Technology Group's Role**
 - Determine which cryptographic algorithms become recommendations and standards.
 - Analyze the algorithm and finalize the specifications for the algorithm

CAVVP

Algorithm Validation Testing

Determining Algorithms to be validated

- **CAVP** develops validation test suites for approved cryptographic algorithms and their complete functions defined in applicable FIPS or NIST Recommendations (published as NIST Special Publication).

CAVP

Algorithm Validation Testing

Testing Philosophy

- Validation test suites are designed to test all specifications (addressable at the algorithm level) within a complete standard or a complete function within that standard
- The complete algorithm implementation must be contained within a single cryptographic algorithm boundary

CAVVP

Algorithm Validation Testing Philosophy “Speedbump”

- But situations exist where a complete implementation or function (as specified in the standard) isn't implemented within one boundary.
- Example: PIV cards
 - Limited processing
 - Limited memory
- Could not fit a complete algorithm or function (as specified in the standard) on the card (or in a single boundary)
- Some of algorithm on PIV card, some on reader, some on PC

CAVVP

Algorithm Validation Testing

Philosophy update: Component testing

- “Better to test something instead of nothing at all.”
- Introduced in 2011
- Provides assurance of the individual components of an algorithm when the complete algorithm or function isn't contained in a single boundary.
- Testing components of a standard - a function or part in a standard – not a mathematical function.
- If there is a need for a component test, contact me to get it added.

CAVVP

Algorithm Validation Testing

Component testing

- **Example:**
 - **ECDSA Signature Generation function**
 - **Steps in function:**
 - Hash message
 - Sign hash
 - **On a PIV card:**
 - Hashing of message done off card
 - Signature of hash done on card
 - **Created ECDSA Signature Generation Component that takes a hash-length input and signs it.**

CAVVP

CAVP Validation Testing

Complete **Algorithms and Components** Currently Available

• Symmetric Algorithms

- AES (FIPS 197)
- Triple DES (ANSI X9.52-1998)

• Asymmetric algorithms

- Both FIPS 186-4 and Legacy functions of 186-2
 - DSA
 - ECDSA
 - RSA

• Modes of Operation

- CMAC (SP 800-38B)
- CCM (SP 800-38C)
- GCM/GMAC (SP 800-38D)
- XTS-AES (SP 800-38E)
- Methods for Key Wrapping (SP800-38F)

• Testing of Components

- All SP 800-56A except KDF
- SP800-56A ECCDH Primitive
- RSASP1 - Mod Exp for Sig Gen (PKCS1.5 and PKCS-PSS)
- RSADP - Basic Decrypt Operation
- KDFs in SP800-135-IKE, TLS, SSH, SNMP
- ECDSA Sign Gen Component (excludes hash)

- SHS (FIPS 180-4)
- SHA-3 (FIPS 202)
- DRBG (SP 800-90A)
- Key Agreement Schemes (SP 800-56A)
- HMAC (FIPS 198)
- SP800-108 KDF

Algorithm Validation Testing

How Component testing is used

- **CMVP requires all applicable components to be tested by CAVP for a specific algorithm**
- **Example 1:**
 - Module includes implementation of SP800-56A. This implementation uses the TLS KDF from SP800-135.
 - The vendor would need to supply 2 validated component tests (CVL) :
 - All SP 800-56A except KDF
 - TLS KDF in SP800-135
- **Example 2:**
 - Module includes ECDSA Signature Generation but the implementation is not contained within one algorithm boundary
 - The vendor would need to supply 2 algorithm validation tests to validate:
 - SHA validation
 - Component test for ECDSA Signature Generation Component

CAVP

Algorithm Validation Testing Development Process

Review the requirements and algorithmic specifications in the cryptographic algorithm documents (SP, FIPS)

- Identify the algorithm's:
 - Components
 - Functionality
 - Mathematical formulas

CAVVP

Algorithm Validation Testing Development Process

Develop and implement the algorithm validation test suite

- Identify the requirements addressable at the CAVP level
- Develop the test metrics for testing the algorithm
- Exercise all mathematical elements of the algorithm
- Assure the specifications in the standard have been implemented correctly
- If deviates, validation test will fail indicating implementation flaw

CAVP

Algorithm Validation Testing Development Process

Develop User Documentation and Guidance

- **Validation System Document (VS)**
 - Documents test suite
 - Provides instructions on implementing validation tests
- **CAVP Frequently Asked Questions (FAQ) document**
 - Provide guidance on
 - General algorithm issues
 - Specific algorithm questions
 - Algorithm interpretation
 - Validation tests
 - Special cases
 - Etc.

CAVP

Algorithm Validation Testing Development Process

Manage Validation Information

- **CAVP Validation Database development**
- **Automation of data entry**
- **Automation of webpage production**

- **CAVP Validation Database features**
 - **Table for every algorithm**
 - **Report production**

CAVP

Algorithm Validation Testing

Types of validation tests

Known Answer Tests (KAT)

- Designed to verify the components of algorithms (Sboxes, permutation tables, etc)

CAVVP

Algorithm Validation Testing

Types of validation tests

Multi-block Message Test (MMT)

- Designed to test the ability of the implementation to process multi-block messages, which may require chaining of information from one block to the next

- The test supplies the IUT with messages that are integral numbers of blocks in length

CAVVP

Algorithm Validation Testing

Types of validation tests

Monte Carlo Test (MCT)

- Designed to exercise entire implementation.

- Purpose: to detect the presence of flaws in the IUT that were not detected with controlled input of KATs

CAVVP

Algorithm Validation Testing

Types of validation tests

Positive testing

- The testing process where the implementation is validated against valid input data. In this testing, only valid sets of values are supplied and the results are checked to see if the expected results are generated.
- Goal: to prove that a given implementation has adhered to the specifications and requirements in the standard
- Used for PQG generation, signature generation, etc. where some values are given and the IUT has to compute the answer.

CAVVP

Algorithm Validation Testing

Types of validation tests

Negative testing

- The testing process where the implementation is validated against invalid input data. A negative test checks if an implementation behaves as expected with its negative inputs.
- Goal: to test the ability of the IUT to recognize valid and invalid values.
- Usually used for PQG Verification, Signature Verification, etc. where all values are provided and the IUT is verifying the correct result is achieved. Errors are introduced into the different parameters to assure the IUT can recognize the errors

CAVVP

Algorithm Validation Testing

Example of test suites and tests used

AES

- **Known Answer Tests**
 - GFSbox
 - KeySbox
 - Variable Key
 - Variable Text
- **Multi-block Message Test**
- **Monte Carlo Test**

Algorithm Validation Testing

Example of test suites and tests used

RSA

- **Key Generation**
 - **Positive testing**
- **Signature Generation**
 - **Positive testing**
- **Signature Verification**
 - **Negative testing**

CAVVP

Algorithm Validation Testing

Example of test suites and tests used

SHA-3

- Options tested

- SHA3-224, 256, 384, 512
- Bit or Byte Orientation
- Support zero length messages or not

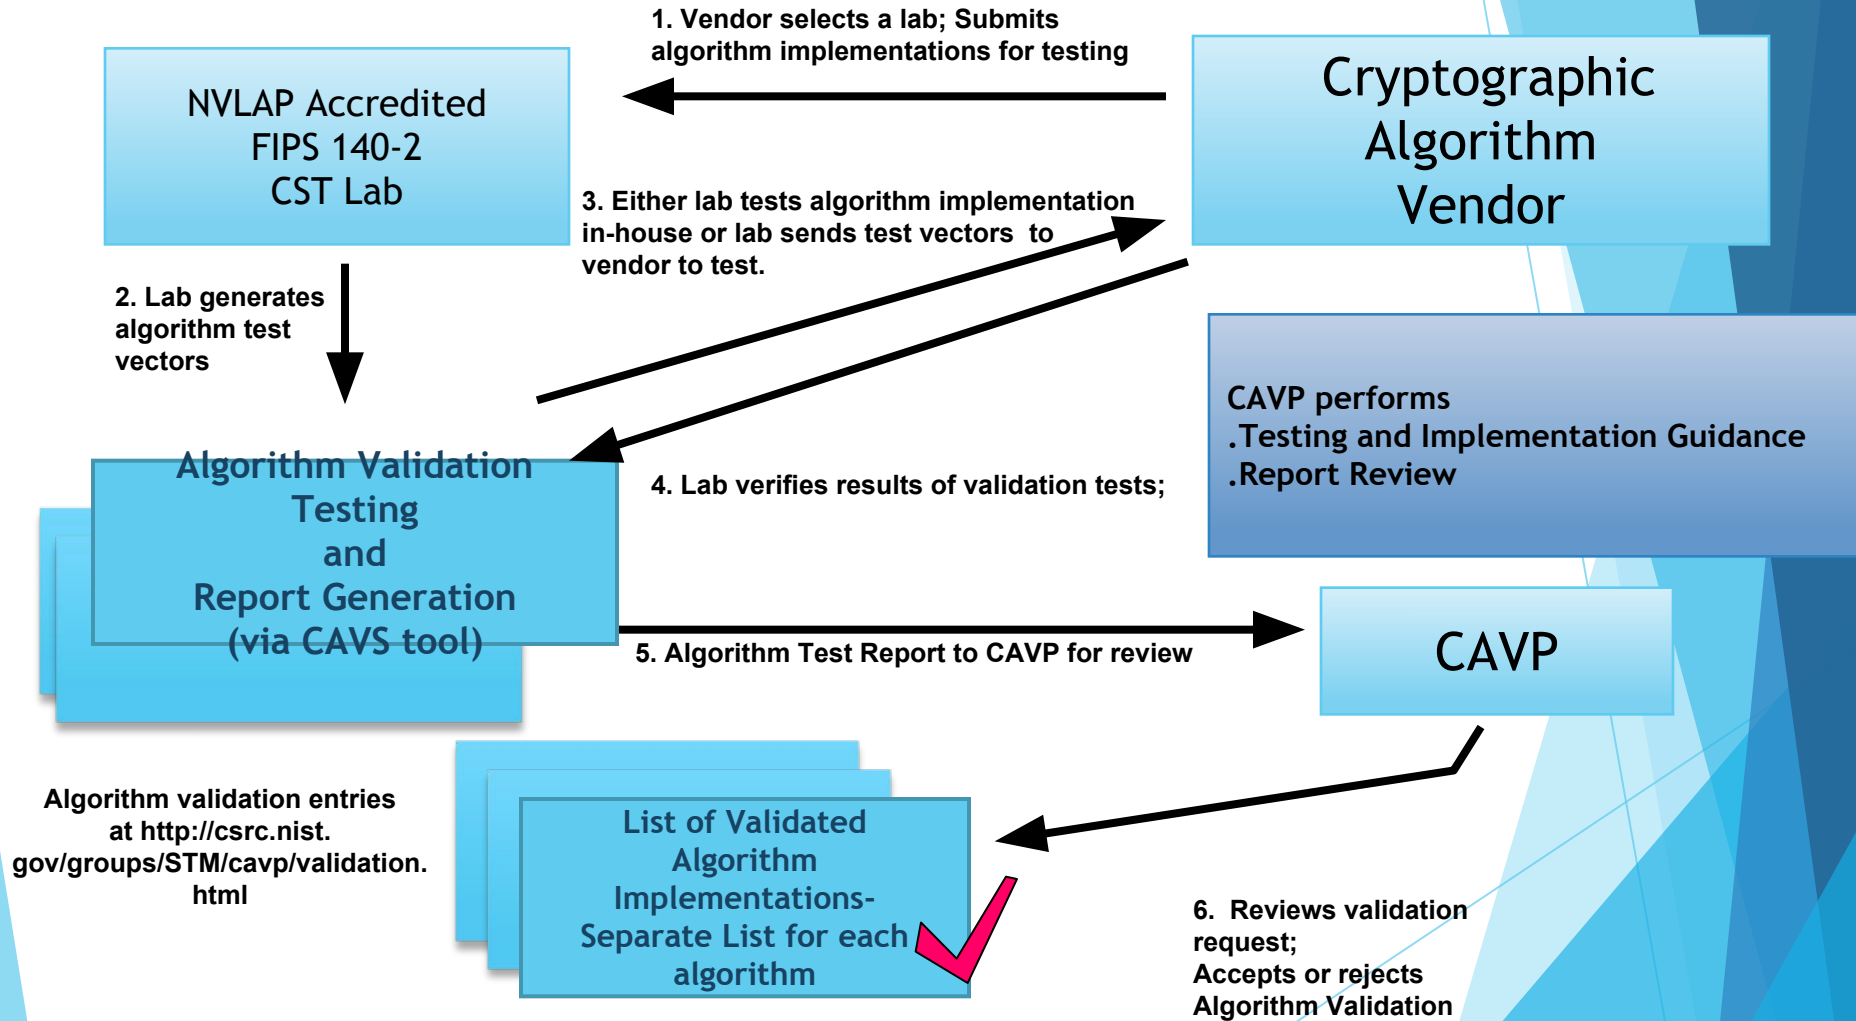

- Test suite:

- Short Messages Test
- Selected Long Messages Test
- Monte Carlo Test

CAVVP

CAVP Test and Validation

Algorithm Validation Testing

Test Suites in Progress

- SP 800-56C Key Derivation through Extraction-then-Expansion
- SP 800-132 Password-Based Key Derivation Part 1: Storage Applications
- Adding SHA-3 to HMAC, DSA, ECDSA, RSA, KAS

CAVVP

Algorithm Validation Testing

Future Algorithm Testing

- **SP800-38G Methods for Format-Preserving Encryption**
- **SP 800-56B (Rev 1): Key Agreement Schemes with RSA – June 2014**
- **SP 800-106 Randomized Hashing for Digital Signatures**
- **SP800-38A Addendum Block Cipher Mode 3 variants of CT Stealing for CBC Mode**
- **SP800-56A (Rev 2) Key Agreement Schemes with DSA and ECDSA**
- **SP800-90A (Rev 1)DRBG**

CAVVP

Algorithm Validation Testing

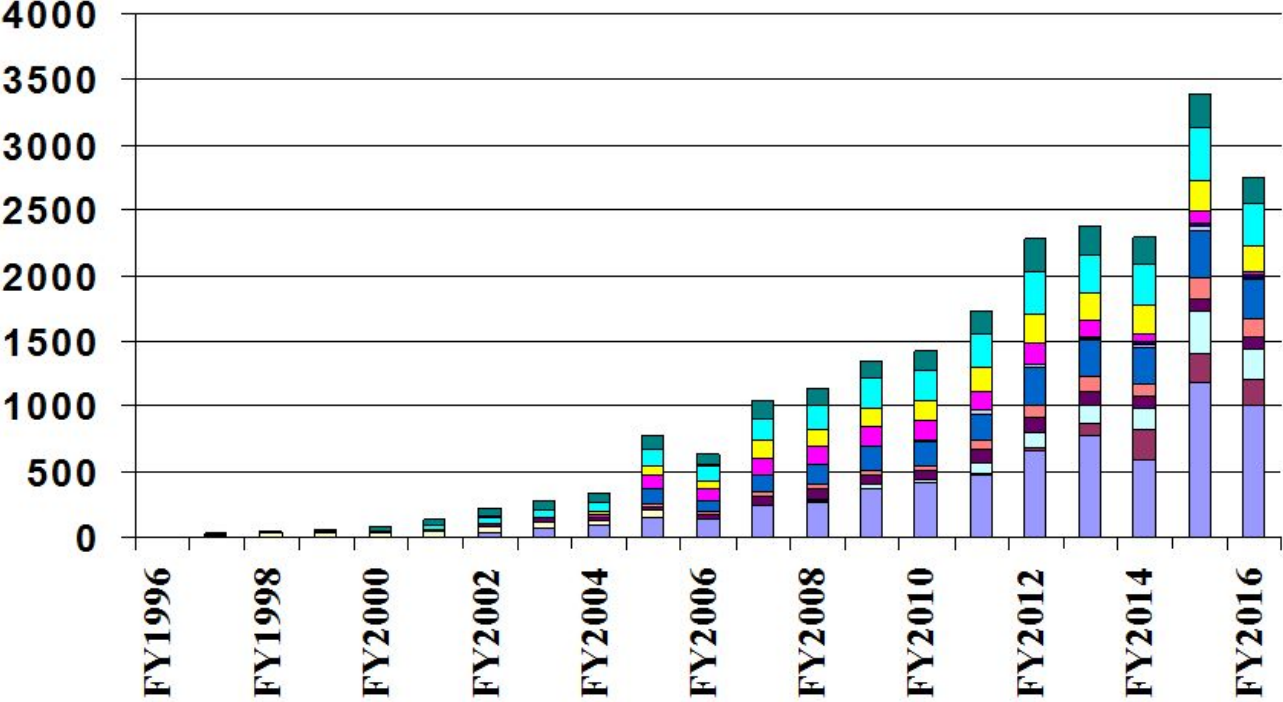

Future Algorithm Testing (In Draft)

- **SP800-90B Draft : Entropy Sources**
- **SP800-90C Draft: construction of RBGS**
